

Why Cloud Computing?

- Imagine you have a good business idea (providing internet-based IT service)
- You'll need
 - Servers
 - Storage
 - Network
 - Security and Maintenance
 - Etc
- One possible approach
 - Buy physical servers and other infrastructure
 - a physical space, power, and cooling are also required
 - Disadvantage
 - High cost for initial setup and system maintenance
 - Risky
 - Difficult to scale (If the number of users increase, you have to buy and configure more resources)
- Cloud Computing approach
 - Above problems can be solved with cloud computing
 - Cloud providers have huge amounts of data storage and servers where SW and security are well maintained.
 - Offering computing resources as scalable, on-demand services.
 - Users only pay for what they use.

Cloud Platforms and Market Share

- AWS (Amazon Web Services)
- Microsoft Azure
- Google Cloud
- etc
